Outline

- Polygon representation
- Winged edge data structure
- 3 Object representation
- Polygon Optimisation

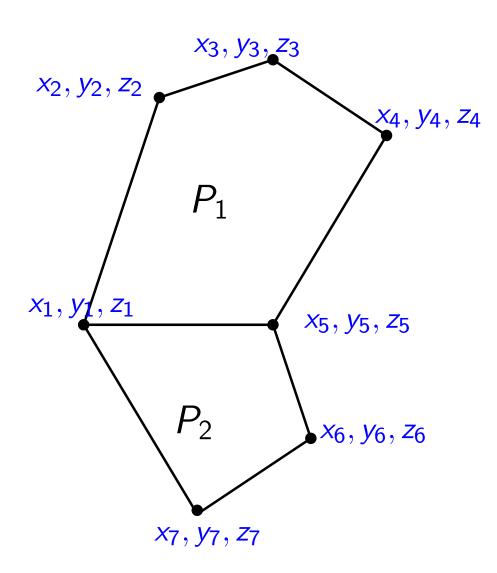

References

Richard Everson 2 / 12

Polygon representation: Vertices explicit

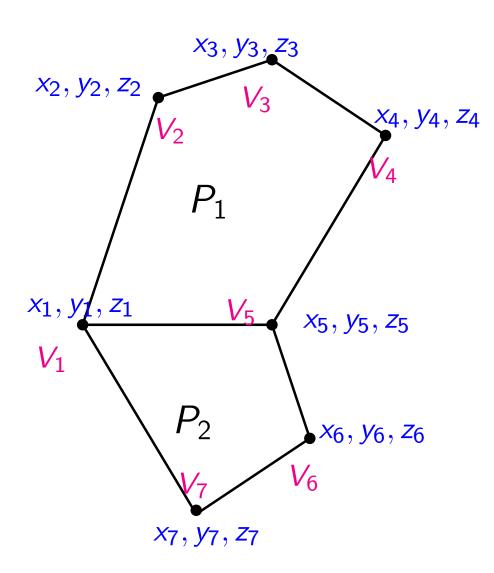

$$P_1 = [(x_1, y_1, z_1), (x_2, y_2, z_2), \ldots]$$

 X_4, Y_4, Z_4 $P_2 = [(x_1, y_1, z_1), (x_5, y_5, z_5), \ldots]$

- Conceptually simple.
- Requires a convention on order of vertices
- No knowledge of shared vertices or edges
- Shared edges drawn twice
- Vertex duplication, so difficult to move vertices

Richard Everson 3 / 12

Polygon representation: Pointer to vertex list

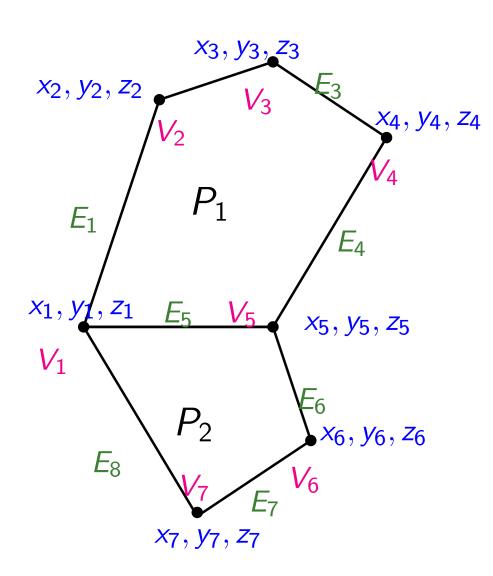

$$P_1 = [V_1, V_2, V_3, V_4, V_5]$$
 $P_2 = [V_1, V_5, V_6, V_7]$
 $V_1 = (x_1, y_1, z_1), \quad V_2 = (x_2, y_2, z_2)$

- Each vertex stored once
- Vertex location easily updated
- Difficult to find common edges
- Edges drawn twice
- Requires convention on order of vertices

Richard Everson 4 / 12

Polygon representation: Edge based

$$E_1 = (V_1, V_2, P_1, P_0)$$

 $E_5 = (V_1, V_5, P_1, P_2)$

- Simple data structure
- Each edge has two vertices
- Each edge shared by at most two polygons
- Dummy polygon P₀ used for edges adjacent to only one polygon
- Good for scan line based rendering
- Vertex location easily updated if pointers to vertices are kept

Richard Everson 5 / 12

Winged edge data structure

- Adjacency relationships: which vertices, edges, polygon are adjacent to a vertex, edge or polygon?
- Winged edge data structure permits vertices and polygons adjacent to an edge to be located in constant time.

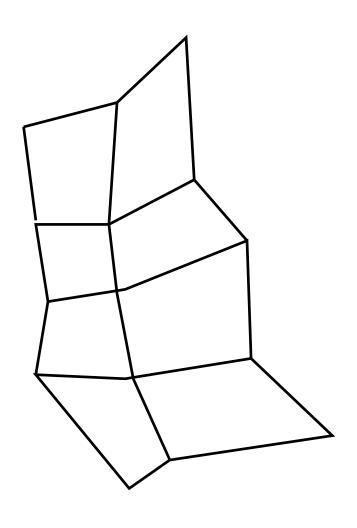

Back-pointers from V_1 , V_2 , P_1 and P_2 to one of their edges.

Richard Everson 6 / 12

Polygon representation: Rectangular mesh

Vertices arranged in a regular $N \times M$ array

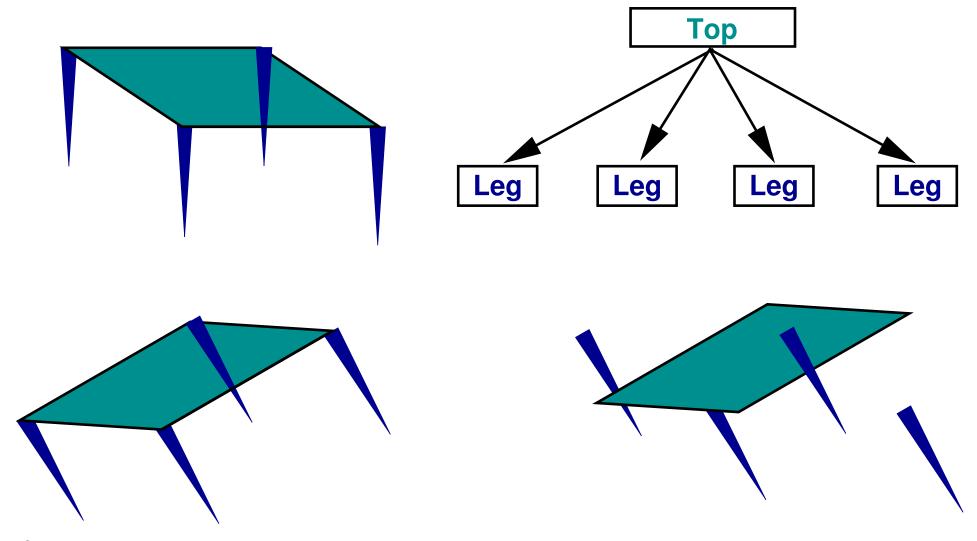

- Edges connect vertices to form mesh
- Edge shared by at most two vertices
- Vertices indexed by mesh coordinates
- Frequently generated by procedural methods (e.g., fractal subdivision)
- Some geometries may not conform to Cartesian structure (e.g., insertion of a new vertex)

 Some graphics hardware (e.g., Silicon Graphics) supports triangle strips and triangle fans

Richard Everson 7 / 12

Object representation

Organise objects in a hierarchy

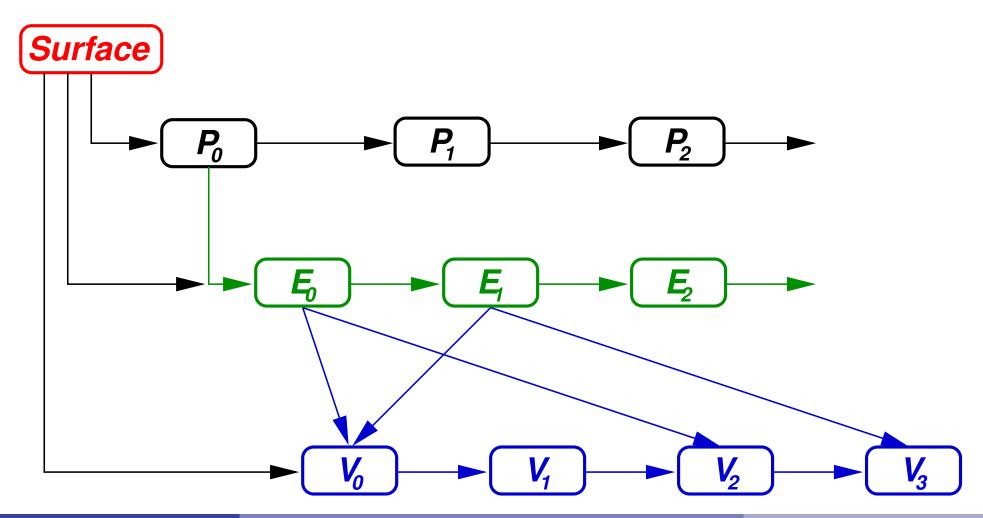

• Propagate transformations to the object through to component parts

Richard Everson 8 / 12

Object representation

Hierarchical structure

 $\mathsf{Object} \longrightarrow \mathsf{Surface} \longrightarrow \mathsf{Polygon} \longrightarrow \mathsf{Edge} \longrightarrow \mathsf{Vertex}$

Richard Everson 9 / 12

Attributes

Object

- List of vertices
- List of surfaces
- Transformation

Surface

- List of polygons
- Common details of appearance

Polygon

- Normal
- Area
- Convex?
- Type (triangular, etc)
- Coefficients defining plane

Edge

- Length
- Between polygons or surfaces?
- Polygons

Vertex

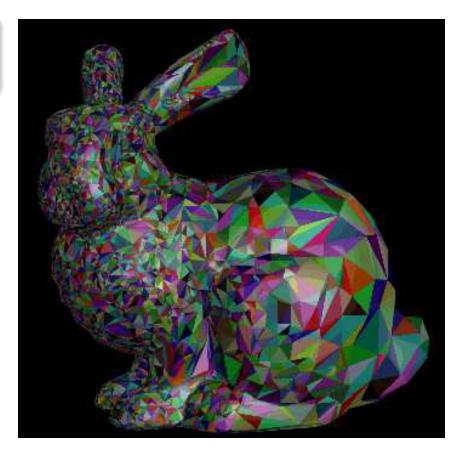

- Location
- Refs to polygons containing vectex
- Vertex normal
- Coordinates in texture map

Richard Everson 10 / 12

Polygon simplification

Minimise polygon count while maintaining perceptual fidelity

- Merge adjacent polygons when dihedral angle is small
- Delete vertices close to common plane of shared polygons
- Merge polygons when curvature is small
- Mesh simplification: merge polygons dependent on required level of detail.
- Hidden edge removal
- Progressive rendering
- Skillful design

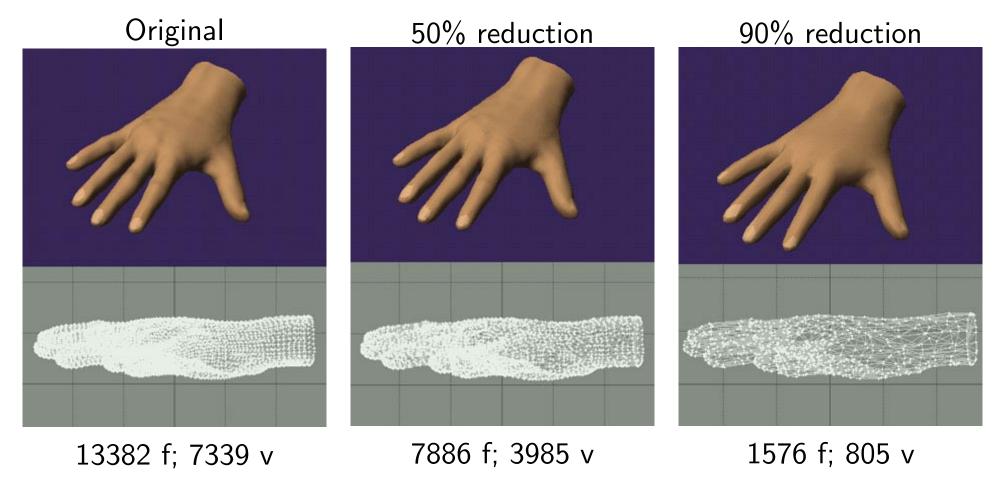

Simplification dependent upon curvature.

Cohen et al, "Simplification envelopes" SIGRAPH 1996
